

I. Let  $C$  be the circle  $x^2 + y^2 = 1$  in the  $xy$ -plane, oriented counterclockwise. Regard  $C$  as parameterized (12) by the vector-valued function  $\vec{r}(t) = \cos(t)\vec{i} + \sin(t)\vec{j}$ ,  $0 \leq t \leq 2\pi$ . Note that the velocity vector  $\vec{r}'(t) = -\sin(t)\vec{i} + \cos(t)\vec{j} = -y\vec{i} + x\vec{j}$  has length 1, so it equals the unit tangent vector  $\vec{T}$ .

1. Calculate  $\int_C (y\vec{i} - x\vec{j}) \cdot d\vec{r}$ , directly from the definition of the line integral of a vector field.

2. Calculate  $\int_C (y\vec{i} - x\vec{j}) \cdot d\vec{r}$ , by direct calculation using the fact that  $\int_C (P\vec{i} + Q\vec{j}) \cdot d\vec{r} = \int_C P dx + Q dy$ .

3. Calculate  $\int_C (y\vec{i} - x\vec{j}) \cdot d\vec{r}$ , using the interpretation of the line integral of a vector field as an integral involving the expression  $\vec{F} \cdot \vec{T}$ .

4. Calculate  $\int_C (y\vec{i} - x\vec{j}) \cdot d\vec{r}$ , using Green's Theorem.

**II.** Tell what Clairaut's Theorem says.  
(3)

**III.** Let  $S$  be the surface given by  $x = u \cos(v)$ ,  $y = u \sin(v)$ , and  $z = u$ , where the domain of the parameterization is the rectangle  $0 \leq u \leq 1$  and  $0 \leq v \leq 2\pi$ .  
(9)

1. Carry out the steps in the computation that  $\|\vec{r}_u \times \vec{r}_v\| = \sqrt{2}u$ .

2. Calculate  $\iint_S x^2 dS$ .

3. Calculate  $\iint_S z^2 \vec{k} \cdot d\vec{S}$ .

- IV.** State Stokes' Theorem (not all the hypotheses, just the main formula). Use it to calculate the line integral  
(8)  $\int_C (x\vec{i} + y\vec{j} + (y^2 - x^2)\vec{k}) \cdot d\vec{r}$ , where  $C$  is the boundary of the part of the paraboloid  $z = 1 - x^2 - y^2$  that lies in the first octant (assume that  $C$  is oriented counterclockwise when viewed from above).

- V.** Verify that the Divergence Theorem is true for the vector field  $\vec{F}(x, y, z) = x\vec{i} + y\vec{j} + z\vec{k}$  on the region  $E$   
(8) which is the unit ball  $x^2 + y^2 + z^2 \leq 1$ .

**VI.** Use the Fundamental Theorem of Calculus to carry out a partial calculation of  $\iint_R \frac{\partial P}{\partial x} dA$ , where  $R$  is the  
(3) rectangle  $-1 \leq x \leq 1$ ,  $0 \leq y \leq 2$ , and  $P(x, y)$  is a function of  $x$  and  $y$ .

**VII.** Find a vector field  $\vec{F}$  in the plane so that if  $C$  is any path in the plane, and  $C$  starts at  $P$  and ends at  
(3)  $Q$ , then  $\int_C \vec{F} \cdot d\vec{r}$  equals the product of the  $x$ - and  $y$ -coordinates of  $Q$ , minus the product of the  $x$ - and  
 $y$ -coordinates of  $P$ .

**VIII.** Use the gradient to find the directional derivative of  $f(x, y) = \sin(xy)$  at the point  $(2, 1)$  in the direction  
(4) toward  $(3, -1)$ .

**IX.** Use implicit differentiation to calculate  $\frac{\partial R}{\partial R_1}$  if  $\frac{1}{R^3} = \frac{1}{R_1^2} + \frac{1}{R_2^2} + \frac{1}{R_3^2}$ .  
(3)

- X.** Give the Riemann sum that approximates the integral  $\int_0^1 \int_0^4 xy \, dx \, dy$  using the partition of the domain shown to the right, and taking the function values at the midpoints of the rectangles. Leave the answer as a sum of fractions, do not compute their sum.

- XI.** The figure to the right shows the graph of the polar equation  $r = \cos(2\theta)$ . Use a double integral in polar coordinates to calculate the area contained inside each one of its loops.

- XII.** Let  $E$  be the portion of the unit ball that has its  $x$  and  $y$ -coordinates positive, that is, the region  $x^2 + y^2 + z^2 \leq 1$ ,  $x \geq 0$ ,  $y \geq 0$ . Let  $S$  be the boundary surface of  $E$ , with the outward normal. Use the Divergence Theorem to calculate  $\iint_S (x^3 \vec{i} + y^3 \vec{j} + z^3 \vec{k}) \cdot d\vec{S}$ .

**XIII.** For the function  $f(x, y) = \sqrt{x^2 + y^2} - \frac{1}{2} \ln(x^2 + y^2)$ , find all critical points of  $f$ .  
(4)

**XIV.** A certain function  $f(x, y)$  has gradient  $e^{x^2} \vec{i} + y \cos(y^2) \vec{j}$ . Its value at  $(0, 0)$  is 6. Find its value at  $(0, 1)$ .  
(4) (Note: you cannot integrate  $e^{x^2}$ , so you cannot calculate an explicit expression for  $f(x, y)$ ).

**XV.** Let  $C$  be the portion of the unit circle that lies in the first quadrant. Find the maximum value of the  
(4) function  $f(x, y) = x^2 y$  on  $C$  by parameterizing  $C$  as  $x = \cos(\theta)$ ,  $y = \sin(\theta)$  and regarding  $f$  as a function of  $\theta$ .
