

Instructions: Give brief, clear answers. "Prove" means "give an argument". In giving definitions, give the *precise* definition, using logical notation and/or set notation as appropriate.

- I.** Write the following as an implication: " $b^2 \geq 2$ for at most one b ".
(2)
- II.** Let $T(p, c)$ be "Person p has traveled to the city c ." Write each of the following statements in logical notation, putting in all necessary quantifiers using the sets \mathcal{P} of all people and \mathcal{C} of all destination cities. If your answer involves a negation, simplify as much as possible.
(4)
- (a) Joan has been to Paris or London.
 - (b) Everyone has traveled to at least one city.
 - (c) No one has traveled to every city.
 - (d) Any two people have traveled to at least one city in common.
- III.** For the function $H: s \rightarrow t$ (where s and t are sets), give definitions of the following. As requested in the instructions, give the *precise* definitions, using logical notation and/or set notation as appropriate.
(10)
- (a) the range of H
 - (b) the preimage of an element T of t
 - (c) the inverse function H^{-1} , assuming that N is bijective (part of giving the definition of a function is telling its domain and codomain).
 - (d) the composition $G \circ H$, assuming that $G: t \rightarrow u$ (part of giving the definition of a function is telling its domain and codomain).
 - (e) $H = K$, where $K: u \rightarrow v$
 - (f) the graph of H
- IV.** Let X be an infinite set.
(4)
- (a) Define what it means to say that X is *countable*.
 - (b) Show a function that verifies that \mathbb{Z} is countable.
- V.** Write out all elements of $\mathcal{P}(\{1, 2\})$ and all elements of $\mathcal{P}(\{1, 2\}) \times \{1, 2, 3\}$.
(4)
- VI.** Let $f: \mathbb{Z} \times \mathbb{Z} \rightarrow \mathbb{Z}$ be the function defined by $f(m, n) = m^2 - n$. Prove that f is surjective.
(4)
- VII.** Let $f: X \rightarrow Y$ and $g: Y \rightarrow Z$. Prove that if f and g are injective, then the composition $g \circ f$ is injective.
(4)
- VIII.** Disprove the following assertion: for all sets A , B , and C , if $A \cap C = B \cap C$, then $A = B$.
(3)
- IX.** Let $f: (0, \pi) \rightarrow (0, \infty)$ be the function defined by $f(x) = \csc(x)$, where the cosecant function is as usual
(8)
- given by $\csc(x) = \frac{1}{\sin(x)}$.
- (a) Prove that f is not injective.
 - (b) Prove that f is not surjective.
- X.** Give an example of a function from \mathbb{R} to \mathbb{R} that is injective but not surjective.
(4)
- XI.** Let $A = \mathbb{R}$ and $B = \mathbb{Z}$. Give examples of each of the following.
(3)
- (a) An element of $A \times B$ that is not in $B \times B$.
 - (b) An element of $B \times A$ that is not in $B \times B$.
 - (c) An element of $A \times A$ that is neither in $A \times B$ nor in $B \times A$.
