Mathematics 3113-005

Quiz 1 Form A

January 28, 2011

Instructions: Give concise answers, but clearly indicate your reasoning. Most of the problems have rather short answers, so if you find yourself involved in a lengthy calculation, it might be a good idea to move on and come back to that problem if you have time.

I. Find infinitely many solutions of the differential equation 5y' = 3y. Start by looking for a solution of the (3) form $y = e^{rx}$, where r is a certain constant.

II. Tell two well-known basic functions that are solutions of y'' = -y.

(2)

(1) (a) Solve the initial value problem $\frac{dy}{dx} = \frac{3}{x^4}$, y(2) = 0. (5) (1) A plant problem $\frac{dy}{dx} = \frac{3}{x^4}$, y(2) = 0.

(b) Apply the Existence and Uniqueness Theorem to this initial value problem (that is, verify that this initial value problem satisfies the hypotheses of the theorem). What does the theorem tell you about the solution you have found?

IV. The separable differential equation $\frac{dy}{dx} = \frac{x^2}{y}$ can be written as $y \, dy = x^2 \, dx$. Integrate both sides of this and solve for y to find the general solution.

V. What basic types of mathematical objects (more basic than "integral") appear on the two sides of this (2) well-known equation: $\int \cos(x) dx = \sin(x) + C$?
