

Quiz 6 Form B

April 8, 2011

Instructions: Give concise answers, but clearly indicate your reasoning.

I. (5) Let $A = \begin{bmatrix} 4t & -1 & 0 \\ 2 & 1 & -t \\ 1 & 2 & 0 \end{bmatrix}$, $B = \begin{bmatrix} 3 & -1 & 0 \\ 2-t & 1 & 1 \end{bmatrix}$, and $C = \begin{bmatrix} -\cos(t) & 3 & 0 \end{bmatrix}$.

- (a) Tell which of the following six products are defined (do not do any calculations, just tell which ones are defined): AB , BA , AC , CA , BC , CB .

BA and CA are defined, AB , AC , BC , and CB are not defined.

- (b) Calculate $\det(A)$.

The easiest way is to expand down the third column of A , since that column contains two zeros. We find that

$$\det(A) = 0 - (-t) \cdot (4t \cdot 2 - (-1) \cdot 1) + 0 = 8t^2 + t.$$

- II. Define what it means to say that a collection of vectors $\{X_1, X_2, \dots, X_n\}$ is *linearly independent*.

(2) It means that $c_1X_1 + c_2X_2 + \dots + c_nX_n = 0$ for constants c_i only when all the c_i are 0.

[or]

It means that if $c_1X_1 + c_2X_2 + \dots + c_nX_n = 0$ for constants c_i , then all the c_i are 0.

- III. Write the system $x'_1 = 8x_1 + tx_2 + \cos(t)$, $x'_2 = x_2 - x_3$, $x'_3 = t + 2tx_2 - x_3$ in matrix form $X' = PX + F$.

(3) Do not proceed further with solving the system, just rewrite the general form $X' = PX + F$ with X , P and F written as matrices with the correct dimensions and entries for this particular system.

$$\begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix}' = \begin{bmatrix} 8 & t & 0 \\ 0 & 1 & -1 \\ 0 & 2t & -1 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} + \begin{bmatrix} \cos(t) \\ 0 \\ t \end{bmatrix}$$

- IV. Write the second-order system $x'' - 2x + y = 0$, $y'' + 2x - 3y = 0$ as an equivalent system of first-order equations.

(3)

We define new functions x_1 , x_2 , y_1 , and y_2 by $x_1 = x$, $x_2 = x'$, $y_1 = y$, and $y_2 = y'$. With these definitions, the second-order system becomes

$$\begin{aligned} x'_1 &= x_2 \\ x'_2 &= 2x_1 - y_1 \\ y'_1 &= y_2 \\ y'_2 &= -2x_1 + 3y_1 \end{aligned}$$

V. For the system $X' = \begin{bmatrix} 0 & 1 & 1 \\ 1 & 0 & 1 \\ 1 & 1 & 0 \end{bmatrix} X$, verify that $X = e^{-t} \begin{bmatrix} 1 \\ 0 \\ -1 \end{bmatrix}$ is a solution.
 (2)

We have $X' = -e^{-t} \begin{bmatrix} 1 \\ 0 \\ -1 \end{bmatrix}$, and we compute that

$$\begin{bmatrix} 0 & 1 & 1 \\ 1 & 0 & 1 \\ 1 & 1 & 0 \end{bmatrix} \cdot e^{-t} \begin{bmatrix} 1 \\ 0 \\ -1 \end{bmatrix} = e^{-t} \begin{bmatrix} 0 & 1 & 1 \\ 1 & 0 & 1 \\ 1 & 1 & 0 \end{bmatrix} \cdot \begin{bmatrix} 1 \\ 0 \\ -1 \end{bmatrix} = e^{-t} \begin{bmatrix} -1 \\ 0 \\ 1 \end{bmatrix} = -e^{-t} \begin{bmatrix} 1 \\ 0 \\ -1 \end{bmatrix} = X' .$$

VI. Bonus problem: Graph the hyperbola $x^2 - \frac{y^2}{2} = 1$, showing the numerical values of the intercepts and the equations of the asymptotes.
 (3)
