

**Problem 1.** In this problem you will prove *Hilbert's inequalities*,

$$\int_0^\infty \int_0^\infty \frac{|f(x)| |g(y)|}{x+y} dx dy \leq C_p \|f\|_p \|g\|_q, \tag{1}$$

where  $f \in L^p([0, \infty))$  and  $g \in L^q([0, \infty))$ , where  $p \in (1, \infty)$  and  $q$  are conjugate exponents, and  $C_p$  is the constant

$$C_p = \int_0^\infty \frac{d\xi}{\xi^{1/p}(1+\xi)}. \tag{2}$$

Using contour integration, one can show that  $C_p = \frac{\pi}{\sin(\pi/p)}$ .

- (a) Prove the so-called *Young's inequality*: let  $\phi : [0, \infty) \rightarrow [0, \infty)$  be a continuous and strictly increasing function with  $\phi(0) = 0$  and  $\lim_{\xi \rightarrow \infty} \phi(\xi) = \infty$ , and  $\phi^{-1} : [0, \infty) \rightarrow [0, \infty)$  be its inverse. Then, for any  $a \in [0, \infty)$  and  $b \in [0, \infty)$ ,

$$ab \leq \int_0^a \phi(\xi) d\xi + \int_0^b \phi^{-1}(\eta) d\eta.$$

One can also show (but you do not have to do this) that equality holds if and only if  $b = \phi(a)$ .

*Hint:* Interpret  $ab$  as the area of the rectangle in the  $(\xi, \eta)$ -plane with sides  $[0, a]$  and  $[0, b]$ ,  $\int_0^a \phi(\xi) d\xi$  as the area under the curve  $\eta = \phi(\xi)$  for  $\xi \in [0, a]$ , and similarly for  $\int_0^b \phi^{-1}(\eta) d\eta$ .

- (b) Take  $\phi(\xi) = \xi^{p-1}$  for  $p \in (1, \infty)$  in Young's inequality, and derive the inequality

$$ab \leq \frac{a^p}{p} + \frac{b^q}{q}.$$

Compare this inequality with Lemma 6.1 from the book.

- (c) If  $C_p$  is defined by (2), show that  $C_p = C_q$ . (Note also that this fact is consistent with the explicit expression for  $C_p$  given above.)
- (d) Without loss of generality, you can assume that the functions  $f$  and  $g$  in (1) satisfy  $\|f\|_p = 1$  and  $\|g\|_q = 1$  (why?). First use the identity from (b) to obtain the inequality

$$\frac{|f(x)| |g(y)|}{x+y} \leq \left( \frac{x |f(x)|^p}{p} + \frac{y |g(y)|^q}{q} \right) \frac{1}{(x+y) x^{1/p} y^{1/q}} \quad \text{for } x \geq 0, y \geq 0,$$

then show that

$$\int_0^\infty \int_0^\infty \frac{x^{1-(1/p)} |f(x)|^p}{(x+y) y^{1/q}} dx dy = \int_0^\infty \int_0^\infty \frac{y^{1-(1/q)} |g(y)|^q}{(x+y) x^{1/p}} dx dy = C_p,$$

and use this result to prove (1).

- (e) Let  $\mathbf{a} = (a_1, a_2, \dots) \in \ell^p$ ,  $\mathbf{b} = (b_1, b_2, \dots) \in \ell^q$  (again,  $p$  and  $q$  are conjugate exponents, both in  $(1, \infty)$ ). Use the same ideas as in (d) to prove the *Hilbert inequality for sums*,

$$\sum_{m=1}^{\infty} \sum_{n=1}^{\infty} \frac{|a_n| |b_m|}{m+n} \leq C_p \|\mathbf{a}\|_p \|\mathbf{b}\|_q .$$

The constant  $C_p$  is the same as above, but do not try to evaluate it as a sum – instead, use some easy bound on a sum by an integral.

**Problem 2.** Let  $(X, \mathcal{M}, \mu)$  be a measure space, and  $f$  be a measurable function on it. Define the function  $\Lambda_f : (0, \infty) \rightarrow [0, \infty]$  by

$$\Lambda_f(\alpha) = \mu(\{x \in X : |f(x)| > \alpha\}) .$$

- (a) To warm up, find  $\Lambda_f$  if  $X = \mathbb{R}$ ,  $\mu$  is the Lebesgue measure, and  $f(x) = e^{-x} \chi_{[0, \infty)}(x)$ .

In the rest of the problem, work for a general measure space  $(X, \mathcal{M}, \mu)$ !

- (b) Show that  $\Lambda_f$  is decreasing and right continuous.
- (c) Prove that if  $|f| \leq |g|$ , then  $\Lambda_f \leq \Lambda_g$ .
- (d) If  $|f_n|$  increases to  $|f|$ , then  $\Lambda_{f_n}$  increases to  $\Lambda_f$ .
- (e) If  $f = g + h$ , then  $\Lambda_f(\alpha) \leq \Lambda_g(\frac{\alpha}{2}) + \Lambda_h(\frac{\alpha}{2})$ .

**Food for thought.** Think about the linear functionals acting on  $C_c(X)$  if the measure  $\mu$  is a Dirac measure concentrated at some point  $x \in X$ .
